

Turf grass plays an important part in our lives. It grows in our gardens and parks. It is not only its use in practice that is important, but also its esthetic and its ability to purify air and water. A carefully considered grass seed mixture will increase the pleasure you get from your ornamental lawn for many years.

## Lawn Clover

### Create a self-sufficient lawn

- Save on fertilizer costs
- Drought tolerant
- Pure or in combination with grass
- Green throughout the year
- Dense lawn

#### Save on fertilizer and water costs

Lawn Clover from Barenbrug contains small leafed white clovers which are drought tolerant. Lawn Clover captures nitrogen from the atmosphere, fixates it in the soil and makes it available for grass growth. This way you create a lawn which is self-sufficient and doesn't need fertilizer anymore. Lawn Clover is fairly drought tolerant which will help you during the dry moments in summer.

#### Pure or in combination with grass

Lawn Clover can be used as monoculture or in combination with grasses. Lawns with pure Lawn Clover are best for low to average traffic. When mixed with grass it's extremely suitable for playing lawns. Lawn Clover combines well with all Barenbrug grass mixtures. Just don't forget to use less fertilizer!

#### Green throughout the year

Lawn Clover grows all year. At times when grass is (starting to go) in winter rest, Lawn Clover ensures that the lawn still retains its beautiful green colour.

#### Dense lawn

Mow frequently and your lawn (mixed) with Lawn Clover will be dense which gives other weeds less chances of survival. The more frequent you mow, the finer the appearance will be. As a bonus your lawn will suffer less and recover faster from pet urine spots. Lawn Clover will help to increase biodiversity; it's a sustainable choice!

### Specifications

Speed of establishment	Average
Nitrogen requirement	Very low
Speed of growth	Fast

- Lawn and public
- Roadsides
- Airports

### Characteristics

Higher wear tolerance

Higher drought tolerance

Quicker establishment

Suitable for shade

Finer leafed

Less maintenance possible

Less fertilizer required

Higher disease tolerance

Self repairing

Germination at low

Quicker germination

Higher winter hardiness

Early spring growth

Sowing rate per m2 pure	10g
Sowing rate mixed with grass	50g /1kg grass
Mowing height	20-30mm
Packaging	10kg
Sowing depth	5mm
